- FOUCTION: RECEPTOR FOR ATP THAT ACTS AS A LIGAND GATED ION CHANNEL. RESPONSIBLE FOR ATP-DEPENDENT LYSIS OF MACROPHAGES THROUGH THE FORMATION OF MEMBRANE PORES PERMEABLE TO LARGE MOLECULES. COULD FUNCTION IN BOTH FAST SYNAPTIC TRANSMISSION AND THE ATP-MEDIATED LYSIS OF ANTIGEN-PRESENTING CELLS.
-!--SUBUNIT: HONG- OR HETEROPOLYMERS (BY SIMILARITY).
-!-- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Description

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ó;
                                                           This peptide comprises an N-terminal peptide of the P45 component of the polymerase enhancing factor (PEF) of Pyrococcus furiosus DSM 3638. It has been obtained from isolated P45. PCR primers DSM 3638. It has been obtained from isolated P45. PCR primers (see AAV63861-64) based on the peptide were used to amplify P45 DNA (see AAV63860). A full-length P45 sequence is provided in AAW72847. PEF, a predominant component of which is P45 protein, enhances the activity of P. furiosus DNA polymerase, thereby providing activity of P. furiosus DNA polymerase, thereby providing to activity of P. furiosus DNA polymerase enhancing activity. The invention provides novel extracts, proteins and complexes that improve the provides novel extracts, proteins and complexes that improve the complexes may include proteins including the P45 N-terminal peptide. Also included are methods for identifying and using these compositions, and specific extracts, proteins and complexes that improve the information to enhance polymerase activity. Noteins and complexes that improve the reactions can be enhanced (claimed) by mixing a nucleic acid polymerase and a composition having polymerase combancing activity. Rise provided for replicating nucleic call mainty activity. Rise in the Rise of the sequencing or amplification (preferably PCR or RT-PCR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polymerase enhancing factor proteins, extracts and complexes improve the polymerisation activity of nucleic acid polymerases, for use in amplification, sequencing and replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polymerase enhancing factor; PEF; dUTPase; DNA polymerase; PCR; amplification; sequencing; replication.

This peptide comprises an N-terminal peptide of the P45 component of the polymerase enhancing factor (PEP) of Pyrococcus furiosus DSM 3638. It has been obtained from isolated P45; a full-length sequence is provided in AAM72847. PEF, the predominant components of which are P45 and P50 (see AAM72844) proteins, enhances the cit withy of P. furiosus DNA polymerase, thereby providing activity of P. furiosus DNA polymerase, thereby providing activity of greater length and purity. P45 is a duTPase and possesses polymerase enhancing activity. The invention provides novel extracts, proteins and complexes that improve the polymerisation activity of nucletc acid polymerases. These complexes may include proteins including the P45 N-terminal peptide. Also included are methods for identifying and using these compositions, and specific extracts, proteins and complexes that included are methods for identifying and using these compositions, and specific extracts, proteins and complexes that included are methods for identifying and using these compositions, and specific activity, for purifying and using these compositions and hance polymerase activity. Nucleic acid polymerase in template, at least 1 polymerase and a composition having polymerase compacting activity. Mixing a nucleic acid template, at least 1 polymerase and a composition having polymerase conhancing activity. Mixing an ucleic acid acid acids. The kits can be used in site-directed mutagenesis, nucleic acids acid sequencing or amplification (preferably PCR or RT-PCR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polymerase enhancing factor; PEF; dUTPase; DNA polymerase; PCR; amplification; sequencing; replication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

The sequence is predicted from a DNA sequence (see AAW6386) obtained from a polymerase enhancing factor (FPF) of Pyrococcus furiosus DSA 3638.

The sequence is predicted from a DNA sequence (see AAW63860) obtained from genomic DNA by PCR. P45 and P50 (see AAW62844) are the corrections of PEF, which acts to enhance the activity of predominant components of PEF, which acts to enhance the activity of cused to enhance nucleic acid replication, polymerisation or PCR caexitons. The invention provides novel extracts, proteins and complexes that improve the polymerisation activity of nucleic acid polymerases, as well as DNA constructs and antibodies. Also included are methods for identifying compositions with PFF activity, for purifying and using these compositions, and specific extracts, proteins and complexes that function to enhance polymerase activity. Choicing a nucleic acid template, at least 1 polymerase and a mixing a nucleic acid template, at least 1 polymerase and a composition having polymerase enhancing activity. Kits are provided for replicating nucleic acids, for site-directed mutagenesis.
improve the polymerisation activity of nucleic acid polymerases, for use in amplification, sequencing and replication

New polynucleotides which encode polypeptides involved in olfactory sensation for identifying olfactory agonists and antagonists  $\,$ 

Claim 11; Page 1172-1173; 1857pp; English.

```
The present sequence is an olfactory receptor which is encoded by one of a number of novel polynucleotides. The polynucleotides can be used in screening for olfactory aganists and antegnonists. The methods allow for the determination of primary scents and the identification of the odour receptors used to detect these primary scents. The methods also enable determination of secondary scents and the identification of combinations of odour receptors that are involved in detecting such secondary scents. This enables the construction of a scent representation (also called a scent fingerprint or scent profile), which may be used to re-create and edit scents. Libraries of olfactory receptors are useful for determining the interaction pattern of a composition with the receptors, and can be used for determining differences in the olfactory faculties of different individuals.
                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents the human P2X7 protein. The invention relates to the P2XM protein, which is significantly homologous to: (i) the P2X family of ATP receptors, and (ii) RP-2 protein which is expressed in thymocytes during apoptosis. Transcription of the genes is specifically regulated by the tumour-suppressor gene p53. The P2XM gene is specifically expressed in skeletal muscle and has been localised to chromosome 22q11, an area where mutation and sequence losses frequently occur in rhabdoid sarcomas. The genes may be used for diagnostic purposes (e.g. by detecting changes occurring in the gene in sarcomas), using probes and primers containing or derived from all or part of the genes. The genes may further be used in the development of new anticancer drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human gene P2XM whose transcription is induced by p53 - useful, e.g. for diagnostic purposes and in development of new anticancer drugs

The coding sequence for this protein can be used to treat disorders of the nervous system, particularly diseases with a component of chronic inflammation, such as Alzheimer's disease, diseases involving acute or chronic inflammation such as rheumatois arthritis, amyloidosis, bacterial, viral and other microbial infections, disorders of the haematopoietic system and immune response such as autoimmune disorders, allergies and lymphoproliferative disorders, diseases involving apoptotic cell death, barticularly tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mammalian purinergic receptor (P2X7) useful for screening for modulators which are useful for treating arthitic, respiratory disorders and neurodegenerative disorders, and to generate receptors specific antibodies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Rat; P2X_7; neuroprotective; nootropic; antinflammatory; antirheumatic; antiarthitic; antibacterial; antiviral; antiallergic; cytostatic; cardiant; cerebroprotective; immunosuppressive; P2Z; purinergic receptor; nervous system disorder; chronic inflammation; Alzheimer's disease; rheumatoid arthritis; amyloidosis; bacterial; viral; microbial infection; haematopoletic system disorder; immune response; autoimmune disorder; allergy; lymphopoliferative disorder; cardiac; cerebral ischaemia;
                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a peptide fragment of rat complement component C5a (the full-length sequence is given in AAB74051). The present invention relates to an antibody specific for the present sequence. The C5a-antibody can be used in a therapeutic composition, which is useful for treating a subject suffering from bacterial infection, e.g. sinusitis, meningitis, respiratory, gastrointestinal or uninary tract infections or infections in wounds. In addition, the C5a antibody can be used for treating sepsis. C5a is also known as anaphylatoxin.
                                                                                                                                                                                                                                                                                                                           Compositions for treating blood-borne and toxin mediated diseases and treatment of sepsis in humans and other animals comprises anti-C5a antibodies generated against C-terminal truncated C5a peptides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is a C-terminal peptide of rat purinergic receptor P2X_7/P2Z. The coding sequence for P2X_7 protein (AAC63693) can be used to treat disorders of the nervous system, particularly diseases with a component of chronic inflammation, such as Alzheimer's disease, diseases involving acute or chronic inflammation such as rheumatoid arthritis, amyloidosis, bacterial, viral and other microbial infections, disorders of the haematopoietic system and immune response such as autoimmune disorders, allergies and lymphoproliferative disorders, diseases and microbial infections, particularly tuberculosis. The present sequence was used to produce a rabbit polyclonal antiserum, which was used in immunohistochemistry of rat P2X_7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                 Mammalian purinergic receptor (P2X7) useful for screening for modulators which are useful for treating arthritic, respiratory disorders and neurodegenerative disorders, and to generate receptors specific antibodies -

The present invention relates to single exon nucleic acid probes (SENP: see AAI3115-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; beta-amyloid precursor protein; beta-APP; diagnosis; cancer; frameshift mutation; age-related disease; neurodegenerative disorder; Alzheimer's disease; Down's syndrome; myotonic dystrophy; neuronal; Huntington's disease; multiple sclerosis; alcoholic liver disease; diabetes multiple sclerosis; alcoholic liver disease; ubidiabetes mellitus type II; microtubule associated protein; Tau; Big Tau; neurofilament-F; presenilin I; presenilin II; cellular tumour antigen; gilal fibrillary acidic protein; GFAPP; pS3; semaphorin III; HUPF-1; bc-1: B-cell leukemia/Lymphoma 2 proto-oncogene; HMGP-C; NSP-A; high mobility group protein-C; neuroendocrine specific protein A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes novel isolated and purified ubiquitin

Conjugation system (UCS) proteins, designated UCSP-1 and UCSP-2. The

CONJUGATION of a medical proteins are part of the UCS, a major pathway for the degradation

of cellular proteins in eukaryotic cells. The UCS mediates the

climination of abnormal proteins and regulates the half-lives of

important regulatory proteins that control cellular processes such as

gene transcription and cell Gycle progression. The UCS is implicated in

the degradation of mitotic cyclic kinases, oncoproteins, tumour

suppressor genes (e.g. p53), viral proteins, cell surface receptors

associated with signal transduction, transcriptional regulators and other

mutated or damaged proteins. Therefore, UCSP-1 proteins may be used to

treat disorders associated with the inappropriate expression or activity

of UCS proteins. For example, UCSP-1 may be administered to treat cancer

cell sarrocytomas, melanomas, lymphomas and cancers of the breast, brain

and prostate), immune disorders, smooth muscle disorders (e.g. angina,

and prostate), immune disorders, smooth muscle disorders (e.g. angina,

cell measles, gastrochereitis, Epstein-Barr virus infections and

hepatitis). The UCSP-1 proteins may also be used as antigens in the

production of antibodies or in assays to identify modulators of UCS

function. This sequence represents the bovine CEP protein which is used

in the description of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptide #11042 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -NUC-8
                                                                                                                                                                                                                                                                              This invention describes a novel method for the diagnosis of a disease caused by, or associated with, an RNA molecule that has a frameshift mutation. The method is used to diagnose age-related diseases, especially cancer and a wide range of neurodegenerative disorders (e.g. Alzheimer's disease, Down's syndrome, myotonic dystrophy, Huntington's disease, especially cancer and a wide range of neurodegenerative disorders (e.g. Alzheimer's disease, Down's syndrome, myotonic dystrophy, Huntington's disease, and litus type II

Can many others listed) or susceptibility to these disorders. The method allows a definitive diagnosis of Alzheimer's disease in living patients, allows a definitive diagnosis of Alzheimer's disease in living patients, allows a definitive diagnosis of Alzheimer's disease in living patients, can early stage. It is based on the observation that disease may be caused by mutations in RNA rather than DNA. The invention describes the used of neuronal system RNA molecules, specifically proteins including proteins Tau and Big Tau, ubiquitin B, apolipoprotein E, microtubule associated protein 2 (MAP2), neurofilament-L, neurofilament-M, con neurofilament-F, presentlin I, presentlin II, glial fibrillary acidic protein (GFAP), the cellular tumour antigen p53, B-cell leukemia/lymphoma 2 (bcl-2) proto-oncogene, semaphorin III, HUPF-I, high mobility group protein-C (HMGP-C) and neuroenine specific protein A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence; corn.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                           Diagnosing disease by detecting frameshift mutations in RNA or corresponding protein mutations - used to diagnose cancer and neurological diseases, particularly Alzheimer's disease, and also for treatment and prevention with specific ribozymes or wild-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .;

The invention relates to assays for measuring in-vivo levels of activated mannan-binding protein-associated serine protease (MASP-1 and MASP-2) activity. The assay comprises contacting a sample of blood or plasma comprising a metal ion chelator with a substrate of formula:

R-peptide-Y: wherein the peptide comprises at least 4 residues from the C-terminus of an anaphylatoxin selected from C3a, C4a and C5a; R is a peptide blocking, protecting or capping group; and Y is any group cleavable from the substrate by MASP and comprises a labelled tag. The substrate of the invention is also useful for monitoring in vitro and in vivo complement-activation (C-activation) by classical, alternative detecting or monitoring a condition associated with complement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            activation. The conditions include microbial infections caused by particularly cytomegalovirus (CMV), hepatitis virus and human immunodeficiancy virus (HTV), organ transplant rejection, tissue injury, autoimmune diseases (e.g. rheumatoid arthritis, systemic lupus erythematosus (SLE)) and inflammatory responses (e.g. in Alzheimer's disease and bacterial diseases). The assay of MASP is also useful for assessing the toxicity or injury of therapeutic treatments or screening test compounds as agents for treatment of viral diseases, parasitic infections, tissue injury, organ transplant rejection, autoimmune diseases or inflammatory responses. The present sequence is mouse
Method for determining in-vivo levels of activated mannan binding protein-associated serine protease enzyme, and new peptide derivatives
                                                                                                               Claim 3; Column 51-52; 39pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           C5a anaphylatoxin

Compositions for treating blood-borne and toxin mediated diseases and treatment of sepsis in humans and other animals comprises anti-C5a antibodies generated against C-terminal truncated C5a peptides

Example 1; Page 26; 84pp; English.

The present sequence is rat complement component C5a. The present invention relates to an antibody specific for the present sequence. The C5a-antibody can be used in a therapeutic composition, which is useful for treating a subject suffering from bacterial infection, e.g. sinusatis, meningitis, respiratory, gastrointestinal or urinary tract infections or infections in wounds. In addition, the C5a antibody can be used for treating sepsis. C5a is also known as anaphylatoxin.

PS71240

molybdopterin biosynthesis protein E chain [similarity] - Pyrococcus horikoshii

N.Alternate names: maaE protein; molybdopterin-converting factor 16K chain; molybdopteril
C;Species: Pyrococcus horikoshii
C;Species: Pyrococcus horikoshii
C;Accession: F71240

A3261B
DNA-directed RNA polymerase (EC 2.7.7.6) II 23K chain [validated] - human
N;Alternate names: RNA polymerase II chain RPB5
C;Species: Homo saplens (man)
C; Species: Homo saplens (man)
C; Date: 21-May-1990 & sequence_revision 17-May-1996 #text_change 28-Jul-2000
C; Accession: $52002; A32618; A39879
R;Checon, J. 14, 143-150, 1995
A;Title: Human RPB5, a subunit shared by eukaryotic nuclear RNA polymerases, binds human A; Reference number: $52002; MUID:95129541
A; Reference number: $52002; MUID:95129541

CC THIS STATEMENT OF THE LEUKOTOXIN.

-1. FUNCTION: INVOLVED IN THE TRANSPORT OF THE LEUKOTOXIN.

-1. SUBCELLULAR LECATION: INNER MEMBRANE=DOUND (POTENTIAL).

-1. SUBCELLULAR LECATION: INNER MEMBRANE=DOUND (POTENTIAL).

-1. SIMILARITY: BELONGS TO THE HLYD FAMILY OF SECRETION PROTEINS.

CC THIS SWISS-PROT ENLY; IS COPYTIGHT. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation.

- FUNCTION: RECEPTOR FOR ATP THAT ACTS AS A LIGAND GATED ION CHANNEL. RESPONSTBLE FOR ATP-DEPENDENT LYSIS OF MACROPHAGES THROUGH THE FORMATION OF MEMBRANE PORES PERMEABLE TO LARGE MOLECULES. COULD FUNCTION IN BOTH FAST SYMAPTIC TRANSMISSION AND THE ATP-MEDIATED LYSIS OF ANTIGEN-PRESENTING CELLS.
- SUBUNIT: HOWO- OR HETEROPOLYMERS (BY SIMILARITY).
- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
- SUBLIBARITY: BELONGS TO THE P2X RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

THIS SUBUNIT: 12 PRESENT IN 2-POLD MOLAR EXCESS OVER THE OTHER SUBUNITS. SUBCELLULAR LOCATION: UNCLEAR.

MISCELLANBOUS: THREE DISTINCT ZINC-CONTAINING RNA POLYMERASES ARE POUND IN EUGRAFORT (NUCLEI: POLYMERASE I FOR THE RIBOSOMAL RNA PRECURSOR, POLYMERASE II FOR THE MRNA PRECURSOR, AND POLYMERASE SILI FOR THE MRNA PRECURSOR, AND POLYMERASE SILI FOR THE ARRA GENES.

SIMILARITY: BELONGS TO THE ARCHAEBACTERIA RPOH / EUKARYOTIC RPB5 RNA POLYMERASE SILIARM FAMILY.

OROTATE PHOSPHORIBOSYLTRANSFERASE (EC 2.4.2.10) (OMPPPASE) (OPRT).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MOI. Gen. Genet. 235:74-80(1992).
-!- CATALYTIC ACTIVITY: OROTIDINE-5'-PHOSPHATE + PYROPHOSPHATE = OROTATA + 5-PHOSPHO-ALPHA-D-RIBOSE 1-DIPHOSPHATE.
-!- PATHWAY: FIFTH STEP IN PYRIMIDINE BIOSYNTHESIS.
-!- SIMILARITY: BELONGS TO THE PUBLINE/PYRIMIDINE
PHOSPHORIBOSYLTRANSFERASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Eukaryota; Fungi; Ascomycota; Pezizomycotina; Sordariomycetes;

This peptide comprises an N-terminal peptide of the P45 component of the polymerase enhancing factor (PEP) of pyrococcus furiosus DSM 3638. It has been obtained from isolated P45; a full-length sequence is provided in AAW2847. BEF, the predominant components of which are P45 and P90 (see AAW2844) proteins, enhances the replication products of greater length and purity. P45 is a ctivity of P. furiosus DNA polymerase, thereby providing a ctivity of P. furiosus DNA polymerase, thereby providing provides novel extracts, proceins and complexes that improve the polymerisation activity of nucleic acid polymerases. These complexes may include proteins including the P45 N-terminal polymerase enhancing activity, for purifying and using these compositions, and specific extracts, proteins and complexes that included are methods for identifying and using these compositions, and specific extracts, proteins and complexes that included are methods for identifying and using these compositions, and specific activity, for purifying and using these reactions can be enhanced (claimed) by mixing a nucleic acid template, at least 1 polymerase and a composition having polymerase inhancing activity. Kits are provided for replicating nucleic acid sequencing or amplification (preferably PCR or RT-PCR).
                                                                                                                                                                                    Polymerase enhancing factor proteins, extracts and complexes -
improve the polymerisation activity of nucleic acid polymerases, for
use in amplification, sequencing and replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polymerase enhancing factor; PEF; dUTPase; DNA polymerase; PCR; amplification; sequencing; replication.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                    This is the amino acid sequence of the P45 component of the polymerase enhancing factor (PEF) of Pyrococus furiosus DSM 368.

The sequence is predicted from a DNA sequence (see AAV63860) obtained from genomic DNA by PCR. P45 and P50 (see AAW2844) are the redeminant components of PEF, which acts to enhance the activity of PF furiosus DNA polymerase. P45 functions as a durpase, and can be used to enhance nucleic acid replication, polymerisation or PCR complexes that improve the polymerisation activity of nucleic acid polymerases, as well as DNA constructs and antibodies. Also included are methods for identifying compositions with PEF activity. For printifying and using these compositions, and specific extracts, or proteins and complexes that function to enhance polymerase activity. Wucleic acid polymerase reactions can be enhanced (claimed) by mixing a nucleic acid template, at least 1 polymerase and a composition having polymerase enhancing activity. Mixs are provided for replicating nucleic acid sequencing or site-directed mutagenesis, for nucleic acid sequencing or amplification (preferably PCR or PPCR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 LILERIKLPDDVMGDMKIRSSLAREGVIGSFAWVDPGWDGNLTLMLYNASNEPVELRYGE 120

                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                             This is the uridine-binding motif of the P45 component (see
AAW72847) of the polymerase enhancing factor (PEF) of Pyrococcus
C furiosus DSM 368. P45 has been identified as a durpase that
that polymerase enhancing activity. Sequences are provided (see
AAW72849-57) of the uridine-binding motifs of dUTPasses and dCTP
C deaminases of P. furiosus, Methanococcus jannaschii, Desulfurolobus
ambivalens, Escherichia coli, yeast, human and herpesvirus; a
consensus (see AAW72848) is also provided. A claimed method of
the reaction in the presence of one or more of the following: a
the reaction in the presence of one or more of the following: a
C PEF, a dUTPasse, a protein that turns over dUTP and a protein
having one or more of the sequences provided in AAW72848-57. A
C claimed protein having PEF activity comprises one or more of
sequences given in AAW72848-57. A
C claimed protein having PEF activity surprises one or more of
ucclaimed protein having PEF activity surprises one or more of
sequencing or for site-directed mutagenesis, for nucleic acid
sequencing or for amplification (preferably PCR or RT-PCR).
                                                         Polymerase enhancing factor proteins, extracts and complexes -
improve the polymerisation activity of nucleic acid polymerases, for
use in amplification, sequencing and replication
                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

This peptide comprises an N-terminal peptide of the P45 component of the polymerase enhancing factor (PEP) of Pyrococcus furiosus DSM 3638. It has been obtained from isolated P45. PCR primers can AAV63861-64) based on the peptide were used to amplify P45 DNA (see AAV63860). A full-length P45 sequence is provided in AAW72847. PEP, a predominant component of which is P45 protein, enhances the activity of P. furiosus DNA polymerase, thereby providing activity of P. furiosus DNA polymerase, thereby providing replication products of greater length and purity. P45 is a durpase and possesses polymerase enhancing activity. The invention provides novel extracts, proteins and complexes that improve the polymerisation activity of nucleic acid polymerases. These complexes may include proteins including the P45 N-terminal peptide. Also included are methods for identifying compositions (with polymerase enhancing activity, for purifying and using these compositions, and specific extracts, proteins and complexes that function to enhance polymerase activity. Nucleic acid polymerase compositions can be enhanced (claimed) by mixing a nucleic acid polymerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 template, at least 1 polymerase and a composition having polymerase enhancing activity. Kits are provided for replicating nucleic acids. The kits can be used in site-directed mutagenesis, nucleic acids sequencing or amplification (preferably PCR or RT-PCR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polymerase enhancing factor; PEF; DNA polymerase; dUTPase; PCR; amplification; sequencing; replication.

Type III secretion systems allow bacteria to target virulence factors directly at host cells. The present sequence is the Orf9 protein of B. pertussis. The present protein is encoded by a Class II type gene and is an effector protein involved in the type III secretion system of B. pertussis i.e. a Bordetella pathogenicity protein. The gene of the present protein is located within a pathogenicity island (see AAA64890). A pathogenicity island is a compact, distinct genetic unit carrying

use in amplification, sequencing and replication
                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                             This is an N-terminal peptide of the P45 component of the polymerase enhancing factor (PEF) of Pyrococous furiosus DSM 3638. PEF, the predominant components of which are P50 (see AMV72844) and P45 (see AMV72847), enhances the activity of P. furiosus DNA polymerase. P45 functions as a durphase. The invention provides novel extracts, proteins and complexes that improve the polymerisation activity of nucleic acid polymerases. These can be used to improve nucleic acid replication, polymerisation and amplification (especially in PCR or RT-PCR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Orf9; bacterial infection; anti-bacterial; vaccine; whooping cough; type III secretion system; virulence factor; pathogenicity island.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel polypeptides derived from Bordetella pertussis, useful for treating and diagnosing Bordetella infection

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence represents a bacterial attachment-invasion-locus (AIL) protein, which may be complexed with a therapeutic agent to transport the agent across the gastrointestinal membrane barrier by transcytosis to increase bioavailability 5- to 100-fold. The agent and bacterial protein may be linked via a degradable peptide as equence as a fusion protein. The receptor binding region of the AIL protein involves all or some of the regions from the 4 extracellular loops. This region retains the binding affinity of the protein, and may be used alone or as part of a fusion protein for drug delivery. The protein may be fused with maltose binding
                                                                                                                                                        ;

                                                                                                                                                                                                                                                                    Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                               Gaps
protein (AAR96208) to form a fusion protein (AAR96209) which may be purified easily by amylose affinity chromatography. The delivery system allows improved transport across enterocytes and Peyers patch M-cells. The system is not prone to degradation in the gut or early release of biologically active material, and eliminates the need for parenteral administration.
                                                                                                               ó

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II) and (II) and have antibacterial activity and therefore can be used (II) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the sepidermidis polypeptides (II) via the production of vectors (II) appertides. The polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides may also be used to assay for other inhibitors of their used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH5509 represent specifically claimed S. epidermidis genomic DNA AH5509 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention. AAH5509 to AAH5509 represent oligonucleotide sequences and primers which are used in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4455 to 4472, no sequences are present for SEQ ID NO:4455 to 4472,
                                                                                   ö

```
The present sequence is that of human protease and associated protein-18 (PBPG-18), which is expressed in hemantopoletic, immune, nervous and reproductive tissues. It is encoded by cDNA identified in Incyte clone 2820384 derived from BRSTNOT14 cDNA library. Anti-PPRG antibodies can be used as therapeulic antagonists, reagents for diagnosis and monitoring diseases and for isolating PPRG. PPRG nucleotide sequence can be used as probe or primer for diagnosis and monitoring proliferative disorders like cancer, arteriosclerosis, atherosclerosis, proliferative disorders like cancer, arteriosclerosis, atherosclerosis, Addison's disease, adult respiratory distress syndrome, allergies, ankylosing spondylitis and amyloidosis syndrome, allergies,
